

# PLUTO Safety PLC

## Message and fault code list

## Message and fault code list. Pluto Safety PLC

### Status messages

No:	Description
- -	Power up
<i>N n</i>	Run mode ( <i>nn</i> = station number)
Lo	Program load mode state. Flashing 'Lo', ready for self programming (program found in other unit)
HA (SR11=7)	Program execution stopped from PC computer or not started after program download. Can be started either from PC or by power off-on.

### User faults

No:	Fault and possible reason.	Reset action
Er10*	Dynamic output short circuited to foreign voltage.	Automatically reset
Er11*	IQ_ for illuminated push button function. Missing diode	Automatically reset
Er12*	Short circuit between two dynamic inputs	Automatically reset
Er13*	Static output Q10..17 (Q20..27) short circuited to 0V or safety Q2,Q3 overloaded	Automatically reset, "K" button
Er14*	Static output Q10..17 (Q20..27) short circuited to 24V.	Automatically reset
Er15	Power supply below 18V	Autom. 3 min or "K" button
Er16	Power supply above 30V	Autom. 3 min or "K" button
Er18	CAN-bus fault. (Short circuit, termination resistor, etc.)	Autom. 3 min or "K" button
Er19	Other unit with same station number on Can-bus	
Er20	PLC-program not loaded	Load of PLC program
Er21	PLC-program CRC-error	Reload with valid PLC-program
Er22	Identifier problem. External identifier can not be read.	Reboot
Er23	Unmatched ID. Identifier doesn't match declaration in program.	Exchange of identifiers or re-declaration of identifier in program.
Er24	Erroneous PLC-code. Invalid PLC-instructions.	Reload with valid code.
Er25	For versions as B16. Non existing output used in program.	
Er26	Baud rate conflict. Unit programmed for other baud rate than current bus baud rate. Note that Pluto must be rebooted after change of baudrate in the PLC program.	Reprogramming or reboot.
Er27	Wrong checksum for unit member in common program.	Reprogramming or reboot
Er28	PLC program does not match the Pluto family. Families: [A/B/S 20, B16], [B/S 46-6], [Pluto AS-i]	Change to other type of Pluto or change the program.
Er29	Unsupported program version. The program contains instructions only supported by later customer specific operating systems.	Update of operating system
Er30	Unsupported function block used	Update of operating system
Er31	IDFIX-PROG program mismatch	Load program to flash memory with "K" button

\*Combined with LED flashing for the affected I/O.

### I/O faults

No:	Fault and possible reason.	Reset action
E r40*	Error safety output Q0 ..5. / Q2,Q3 connected together or to other negative voltage. / Q2,Q3 has to high capacitive load.	"K" button.
E r41*	Error output Q2 or Q3. Overload or connected to foreign positive voltage.	"K" button.
E r42*	Error relay output. No answer from internal relay monitoring when output is off.	"K" button.
Er43*	Error relay output. (Self test of transistors)	Reboot
Er44*	Error relay output. Internal relay does not switch on.	"K" button.
Er45	Analogue functions not calibrated.	System must be calibrated

\*Combined with LED flashing for the affected I/O.

Note: Reboot can either be made from PC computer or by power off-on.

### CPU faults

No:	Fault and possible reason.	Reset action
Er50	Input data difference between processor A and B Processor A and B reads an input differently. The fault is often caused by a bad sensor. Corresponding input LED flashes.	Reboot
Er51	Output data difference between processor A and B. Processor A and B sets a global variable different (Q0..Q3, GM0..11). (The problem can be caused by the PLC-program)	Reboot
Er52	No answer from any internal relay when output is off. (Both relays stuck)	Reboot
Er58	AS-i safety code table CRC error	Reboot, Teach AS-i safety codes
Er59	Calibration analogue functions CRC fault	Reboot
Er60	Twin self test monitoring	Reboot
Er61	Timer IRQ monitoring	Reboot
Er62	Internal serial communication	Reboot
Er63	Boot-flash CRC	Reboot
Er64	OS-flash CRC	Reboot, Reload operating system (OS)
Er65	Plc-flash CRC	Reboot, Reload PLC program
Er66	5 volt under/over voltage monitoring	Reboot
Er67	CPU-test error	Reboot
Er68	Ram-test error	Reboot
Er69	Scan cycle time over run, PLC program too big	Reboot
Er70	System, sum of system and stack monitoring	Reboot
Er71	Pluto used for IDFIX writing. Normal operation ceased	Reboot
Er72	System error. No communication AS-i processor	Reboot
Er73	System error. CRC AS-i processor	Reboot
Er74	Remanent memory error	Reboot

Note: Reboot can either be made from PC computer or by power off-on.

**AS-i**

No:	Fault and possible reason.	Reset action
AE 01	ASi power missing	
AE 02	No connection with ASi master (By monitor mode)	
AE 03	Safety code missing by code teaching	
AE 04	Wrong code table	
AE 05	Global communication fault.	
AC [node no]	Channel fault in safety node	Switch off both channels
Ab [node no]	AS-i slave with bad or wrong safety code.	Routine "Single slave exchange" or teach safety codes (PC) or exchange defect slave.
An [node no]	Slave profile does not match.	Read AS-i slaves
CC [node no]	Code Change. Pluto prepared for exchange of safety slave, one slave is missing. (Acknowledge by "K" button.)	
CC	Code Change. Pluto is prepared for connection of new safety slave.	
CF	Code Found. Code in new safety slave is available. (Acknowledge by "K" button.)	

**In-/Output LED's**

The status of the Input and Output LED's gives additional information for troubleshooting.

Indication	Fault and possible reason.	Reset action
Double flash	Two-channel fault at use of two-channel function block in the PLC program. Double flash on the channel which has opened.	Open and close both channels.
